

Framework for Achieving Operational Consistency

A Practical Guide for Business Owners and Management Teams

Published by Forisa Abadijaya Sejahtera (FAS) • Operations & Governance Practice

Operational excellence is not simply about making operations faster. It is about building an organization where people know what to do, processes are consistently executed, performance is measurable, problems are addressed systematically, and improvements are sustained.

01. WHAT IS OPERATIONAL EXCELLENCE?

Operational excellence is an organization's ability to consistently deliver expected results through six core pillars:

Clear Processes

Standardized workflows that eliminate ambiguity.

Capable People

Skilled teams aligned with role requirements.

Effective Leadership

Disciplined execution and supervisory coaching.

Measurable Performance

KPIs connected to actual operational conditions.

Disciplined Execution

Adherence to standards across all shifts and sites.

Continuous Improvement

Systematic problem-solving and process learning.

The Real Test: Does the operation produce consistent results—even when key personnel, situations, or workloads change?

02. THE OPERATIONAL CONSISTENCY CHALLENGE

A common vulnerability in growing companies is person-dependency: *Good performance → depends on key individuals → people change → performance drops.*

Operational Symptoms

- Varying standards between locations or teams
- Inconsistent SOP execution & poor follow-up
- Frequent escalation of routine operational issues
- KPIs that do not reflect ground realities

Systemic Drivers

- Unclear authority and decision boundaries
- Excessive need for senior management intervention
- Recurring operational issues without root-cause fixes
- Inconsistent customer experience delivery

03. THE OPERATIONAL EXCELLENCE FRAMEWORK

FAS approaches operational excellence through seven interconnected dimensions:

STANDARD → PEOPLE → PROCESS → PERFORMANCE → CONTROL → PROBLEM SOLVING → IMPROVEMENT

04. STANDARD

Operational consistency starts with clearly defined standards answering: *What should happen?*

Core Components of an Operational Standard

05. PEOPLE & CAPABILITY

A process is only as effective as the people executing it. Operational excellence requires ensuring the right people have the required capability.

- **Role Clarity:** Employees must understand their exact responsibilities and authority limits.
- **Targeted Training:** Capability development must address actual execution gaps rather than generic topics.
- **Supervisory Coaching:** Managers must actively mentor teams and reinforce daily standards.

Key Principle: Do not solve every performance problem with training. If the real issue is unclear authority, poor process design, inadequate manpower, or weak supervision, training alone will not solve it.

06. PROCESS & SOP EXECUTION

Processes should make the correct action easier to execute consistently. Evaluate processes across six dimensions:

1. Input Information, tools, or resources required.	2. Process Sequential steps to be executed.	3. Output Expected deliverables & quality.
4. Owner Accountable individual for the workflow.	5. Control Error-proofing & deviation prevention.	6. Measurement Indicators proving process effectiveness.

From Document to Practice: An effective SOP must be *Clear* → *Practical* → *Accessible* → *Measurable* → *Enforceable*. Management must verify whether deviations stem from poor discipline or unworkable SOP complexity.

07. PERFORMANCE MANAGEMENT & ALIGNMENT

Connect overarching business objectives down to front-line daily activities:

Business Target	↓	Dept KPI	↓	Individual KPI	↓	Daily Activity	↓	Result
-----------------	---	----------	---	----------------	---	----------------	---	--------

08. DAILY MANAGEMENT ROUTINES

Operational information should be reviewed continuously to detect deviations early when corrective options are greatest:

Daily Monitoring Checklist • Sales / Production Output & Capacity • Manpower Availability & Attendance • Execution of Critical Operational Activities	Control & Risk Escalation • Customer Complaints & Service Incidents • Urgent Operational Risks & Bottlenecks • Tracking Open Corrective Action Items
--	---

09. CONTROL & ACCOUNTABILITY

For critical operations, eliminate ambiguity by defining: *Who performs it? Who supervises it? Who approves it? Who is accountable for the final result?*

10. PROBLEM SOLVING & ROOT CAUSE ANALYSIS

When an issue occurs, move beyond symptom-level firefighting to permanent system prevention:

Diagnostic Step	Key Analytical Focus
1. What Happened?	Define the precise problem, operational impact, and deviation from standard.
2. Where & Why?	Isolate the function, process step, or team, and analyze contributing factors.
3. Why Undetected?	Evaluate why existing controls, monitoring routines, or supervisory checks failed to catch it early.
4. What Must Change?	Determine systemic changes needed across People, Process, Policy, Technology, Controls, or Leadership.

11. CONTINUOUS IMPROVEMENT CYCLE

Operational excellence is maintained through a disciplined continuous feedback loop:

12. OPERATIONAL EXCELLENCE SCORECARD

Track operational performance across five essential balanced categories:

1. Productivity Output per employee, Revenue per headcount, Labor productivity, Capacity utilization rate.	2. Quality Error rate, Rework frequency, Customer complaints, Service consistency metrics.
3. Process Efficiency SOP compliance rate, Cycle time, Uncontained process deviations, Bottleneck frequency.	4. People & Capability Attendance, Turnover rate, Competency assessment completion, Performance distribution.
5. Management Control KPI achievement rate, Corrective action closure speed, Escalation frequency, Review routine effectiveness.	

13. PRACTICAL 90-DAY OPERATIONAL ROADMAP

DAYS 1–30 DIAGNOSE & MAP

Identify critical operational workflows, map recurring problems, review existing SOPs, analyze ground performance data, and establish baseline KPIs.

Deliverable: Operational Baseline & Priority Gap List

DAYS 31–60 STANDARDIZE & ROUTINIZE

Clarify roles and authority limits, streamline core SOPs, set clear performance standards, launch daily management routines, and coach supervisory teams.

Deliverable: Standardized Operating Framework

DAYS 61–90 CONTROL & SUSTAIN

Monitor execution consistency, review KPI trends, track corrective action closure rates, resolve recurring bottlenecks, and standardize proven solutions.

Deliverable: Operational Improvement & Control System

14. THE OPERATIONAL READINESS CHECK

Standard: Is expected work clearly defined?

People: Do teams have execution capability?

Process: Is the workflow practical & repeatable?

Performance: Are key outputs accurately measured?

Control: Are deviations detected early?

Accountability: Is ownership unambiguous?

15. FAS PERSPECTIVE

Operational excellence is not about creating more rules. It is about creating an operating system where people can consistently deliver expected results without relying on individual heroics.

"If our best employee leaves tomorrow, will the process still work? Good people create good results. Good systems make good results repeatable."
